CHAPTER OUTLINE

- 17.1** The Ottomans and the Mongols
- 17.2** From the Mamluks to Ming China
- 17.3** Gunpowder and Nomads in a Transitional Age

INTRODUCTION The Ottomans rose to prominence at the end of what historians call the Middle Ages and the beginning of the early modern period, arriving on the scene in the thirteenth century. In defeating the Byzantine Empire, the last remnant of ancient Rome, the Ottoman Empire became a gatekeeper between East and West, occupying a central position politically, economically, and culturally in Eurasia. The meeting of the two worlds is represented in the architecture of Istanbul's Suleymaniye Mosque, which combines Islamic architectural elements such as minarets with a large central dome popularized in ancient Mediterranean temples and churches such as the Hagia Sophia in the same city ([Figure 17.1](#)). Hagia Sophia itself was transformed into a mosque by Mehmed the Conqueror when the city fell to Ottoman forces in 1453.

17.1 The Ottomans and the Mongols

LEARNING OBJECTIVES

By the end of this section, you will be able to:

- Discuss the origins of the Ottoman Empire
- Describe how the conflict between the Ottomans and Timur influenced the development of the Ottoman state
- Describe the effect of the conquest of the Byzantine Empire on Europe and the Ottoman Empire
- Describe the intellectual, cultural, and artistic developments of the Renaissance

As the people of western Europe remade their societies following the collapse of the western half of the Roman Empire, the Byzantines in the east preserved Roman cultural practices for centuries, seeing themselves always as the continuation of a proud and strong Mediterranean empire. By the eleventh century, however, the Byzantines found their power challenged by the arrival of Turkic tribes such as the Seljuks, who settled in the eastern half of their domains and gradually wrested control of the area from them. As different Turkic tribes arrived and settled in the region, one group, the Ottomans, soon rose to prominence over others. Withstanding the last major Mongol onslaught, the Ottomans went on to dominate Asia Minor, invade Europe, and eventually deprive the Byzantines of their last remnants of power. The fall of the Byzantine Empire in 1453 sent many Greek scholars and theologians fleeing to the city-states of Italy, where they contributed to the intellectual and artistic transformation of western Europe in the period known as the Renaissance. By the end of the fifteenth century, the Ottomans had transformed the eastern Mediterranean.

Ottoman Growth

With an empire that bordered both the western and eastern worlds, the Ottoman Turks began to play an important role in Asian and European affairs in the thirteenth century. They were not the first Turkic-speaking people to do so, however. In the tenth and eleventh centuries, a group of Turkic speakers from central Asia arrived first through the Iranian plateau before continuing westward into the area that is now modern Turkey. This group, called the Seljuks after their ruler, converted to Islam in the tenth century. Accomplished archers and riders, they were originally employed by the armies of the Islamic Karakhanid and Ghaznavid dynasties of central Asia before carving out an empire of their own in Persia, Mesopotamia, and eastern Asia Minor. Seizing control of Baghdad, the capital of the Abbasid Empire and home to the Sunni caliph, in 1055, the Seljuks came to regard themselves as defenders of the Islamic faith and established the Seljuk Empire. Defeating the forces of the Byzantine Empire in 1071 at the Battle of Manzikert in eastern Anatolia (another name for Asia Minor), the Seljuks soon dominated that region as well ([Figure 17.4](#)).

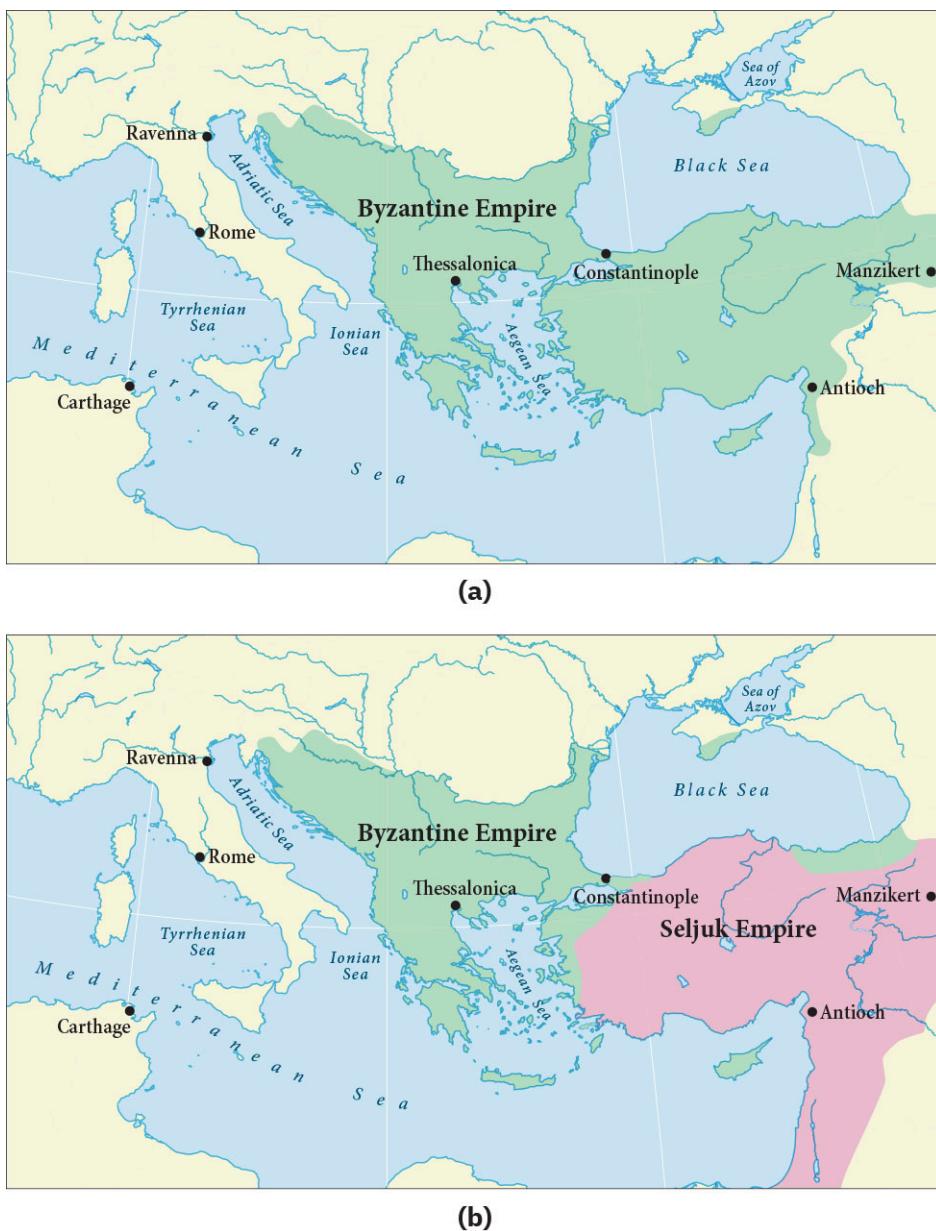

FIGURE 17.4 Incursions of the Seljuk Empire against the Byzantines. Before the arrival of the Seljuk Turks, the Byzantine Empire laid claim to most of Asia Minor (a). Over the course of the eleventh century, the empire's holdings in Asia Minor steadily shrank as the Byzantines were replaced by the Seljuk Turks (b). (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

In 1077, the Seljuks established a state in Anatolia they called the Sultanate of Rum (“Rome”) because the territory had been taken from the Byzantine Empire, the Eastern Roman Empire. The sultanate steadily absorbed other Turkish tribes in Anatolia and brought them under its control, forming a confederation of tribes more than a unified state. The sultanate’s ruler was primarily a military leader, and the provinces were governed by military commanders. Within the provinces, different regions were controlled by different groups of warriors who often fought with one another and sometimes sold their military services to Byzantine rulers.

Seljuk rulers built mosques and madrasas—schools where scholars taught subjects such as science, theology, and Islamic law—especially in Iconium (now Konya), one of the cities that served as the capital of the Sultanate of Rum. They also established caravansaries, inns where merchants traveling along the Silk Roads could safely rest and conduct business. Trade attracted merchants and artisans, and religious scholars took up residence

in the Turkish cities. As the Byzantine Empire lost control of Anatolia, Orthodox Christian clergy and monks fled, loosening the peasants' ties to Christianity and making it easier for many to convert to Islam. Gradually, Anatolia became more Islamic in appearance and nature, and the Byzantine emperors' grip on the region grew ever weaker.

The Seljuk Empire, centered as it was in Baghdad in Mesopotamia, faced many struggles both from within and from outside forces. The arrival into the region of the western crusaders at the very end of the eleventh century and the establishment of the Crusader States caused major political and social shifts in the region, even though those states would eventually be defeated. The Seljuks were defeated by the Khwarezm-Shah, a central Asian dynasty, whose founder had been enslaved by the Seljuks.

As the Seljuk dynasty lost control of the region, the Seljuk Sultanate of Rum—a splinter state of the original group—was left as the sole center of Seljuk power in Anatolia. Even there, however, political and military change continued. Following the Mongols' invasion of eastern Anatolia and their decisive victory over the Seljuks at the Battle of Köse Dağ in 1243, the Sultanate of Rum splintered into numerous small, independent states called *beyliks*. In the fourteenth century, one of these *beyliks* began to rise to prominence as Seljuk fortunes declined in the wake of the Mongol invasions. This *beylik* was led by a man named Osman, and his followers came to be known as the "Osmanli" or "Ottomans."

The Ottomans were Turkic-speaking pastoralists who occupied lands in northwestern Anatolia. Like the Seljuks, they regarded themselves as *ghazis*, warriors who fought to expand and protect the borders and influence of Islam, and this recognition came to form an important part of Ottoman Turkish identity. The Ottomans had originally stepped into the power vacuum left in northwestern Anatolia by the attack on Constantinople in 1204, when European crusaders raided, ransacked, and demolished parts of the city. Civilians were brutally assaulted and killed. Priceless religious relics were looted and destroyed, erasing ties to the history of the Byzantine Empire. After this "sack" of Constantinople, Venice and its allies divided the empire, and political upheaval took place in the years that followed. Although the Byzantines attempted to rebuild their capital and state, they were no match for the Ottomans. The empire lasted another two hundred years, but it controlled relatively little territory in Anatolia. The Ottomans laid siege to the Byzantine cities of Anatolia, conquered them, and made one, Bursa, the capital of a growing Ottoman state with imperial ambitions. They built mosques and madrasas in the city, turning it into an important religious center.

Following Osman's death, his son Orhan I, who took the title of sultan, expanded Ottoman territory into Europe. In 1354, his troops established a base on the European peninsula of Gallipoli, on the northern side of the Dardanelles, one of the straits that separate Asia Minor from Europe. Control of Gallipoli gave the Ottomans control over oceanic traffic between the Mediterranean and the Black Sea. It also gave them the ability to interfere with ships bound for Constantinople, which sat on the European side of the straits of the Bosphorus, should they so desire. The Ottomans steadily took control of the European portion of the Byzantine Empire, the area that is now northern Greece, southern Bulgaria, and Thrace, the western part of modern Turkey.

Orhan's son Murad I established a new capital at Edirne, on the European side of the Dardanelles, in 1362. Turks from Anatolia were invited to settle in Ottoman-controlled territory in Europe and take over the lands of fleeing European landowners. The European peasants who came under Ottoman control did not necessarily resent their new masters; the majority were Orthodox Christians, and they were allowed to practice their faith without interference so long as they paid the special tax, the *jizya*, and recognized their status as Ottoman subjects. The Ottomans also realized that non-Muslim clergy could help in the governing of their empire, because people were accustomed to turning to their religious leaders for direction on a variety of issues. To win the assistance of Christian clergy, therefore, the Ottomans refrained from efforts to stamp out their religion. Many peasants likely regarded the religiously tolerant Ottomans as better overlords than the European Roman Catholic soldiers, who had attacked the Greek Orthodox Byzantine Empire on more than one occasion. They also welcomed the lighter tax burden imposed by the Ottomans.

Murad sought to take advantage of the death of the Serbian king in 1355 and incorporate his land into the

Ottoman domains as well. At the Battle of Kosovo in 1389, the Ottomans defeated the Serbian army and made Serbia, the last major Orthodox Christian state, a vassal of the empire. Both Murad and the Serbian ruler Prince Lazar died in the battle, although Serbian myth claims that a Serbian soldier used trickery to secretly kill the Ottoman sultan in his tent ([Figure 17.5](#)).

FIGURE 17.5 Sultan Murad I. In this image created by an Ottoman artist two centuries after Murad's death, the sultan (left, followed by his guards) is described in the caption at the top as “the Kosovo martyr.” (credit: modification of work “Sultan Murad I šahid” by Unknown/Wikimedia Commons, Public Domain)

The Battle of Kosovo in 1389 serves as a focus for Serbian national identity, and its anniversary is a national holiday. In this blog, you can learn more about how the [Battle of Kosovo](https://openstax.org/l/77BattleKosov) (<https://openstax.org/l/77BattleKosov>) has affected Serbian views about political independence.

Murad's son and successor Bayezid I (called “the Thunderbolt”) attempted unsuccessfully to eliminate all remaining Byzantine governance in the region by capturing Constantinople. In 1396, the Ottomans blockaded the city, but the pleas of the Byzantine emperor led Pope Boniface IX to call for a crusade to rescue the Greek Orthodox Christians from the Muslim Turks. Roman Catholic knights from throughout Europe responded. Ottoman troops, fighting alongside Bayezid's Serbian vassals, crushed the crusader army at the Battle of Nicopolis on the Danube River ([Figure 17.6](#)). The blockade of Constantinople ultimately failed, however, for the Ottomans had no way to break through the city's walls, and Bayezid soon found himself facing a more formidable foe, the Mongol conqueror Timur.

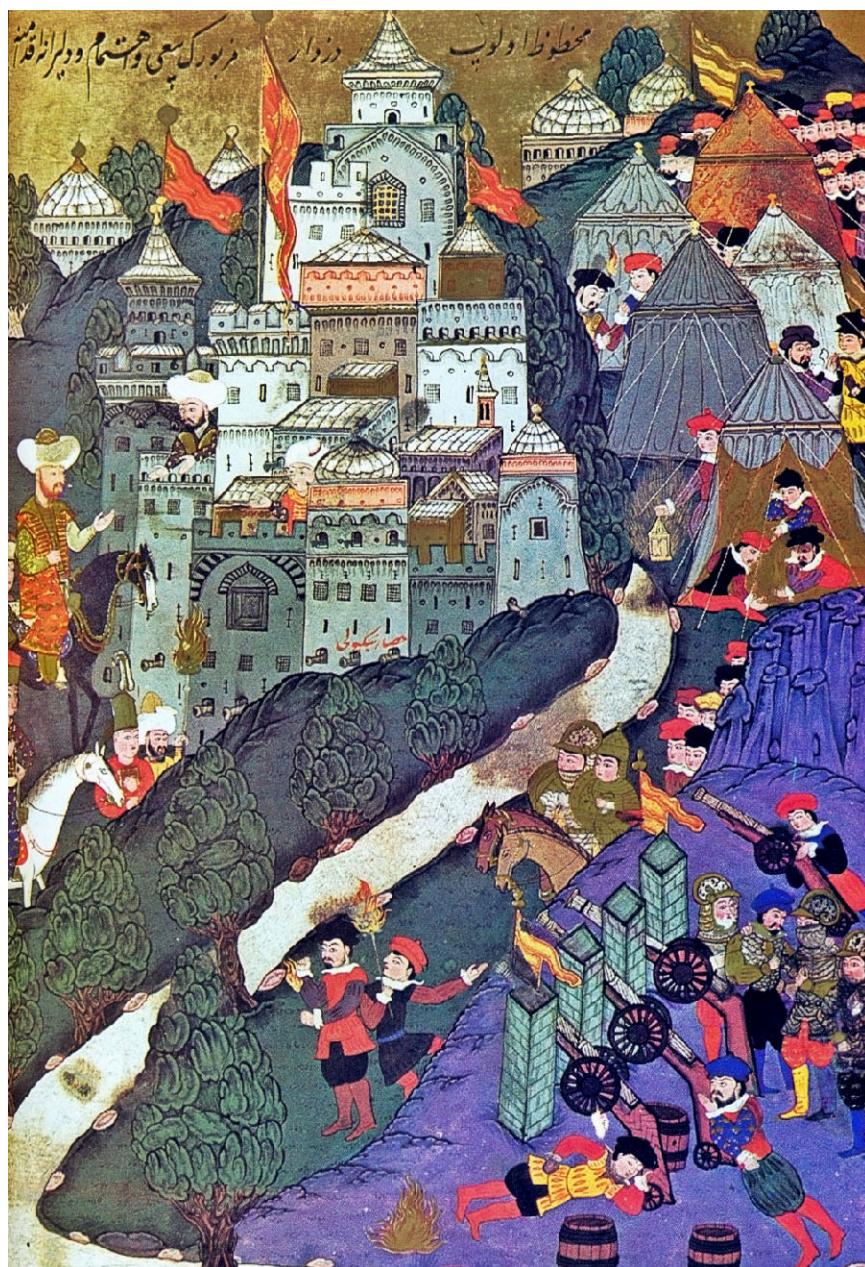

FIGURE 17.6 The Battle of Nicopolis. This 1523 painted miniature by an Ottoman artist depicts the triumphant Ottoman army on the left, defeating the European knights who opposed them at the Battle of Nicopolis in 1396. A miniature painting such as this, which appeared in bound books and manuscripts, was a popular medium of artistic expression throughout Ottoman history. (credit: “Battle of Nicopolis, 1396” by Géza Fehér/Wikimedia Commons, Public Domain)

The Timurids and the Aftermath of the Battle of Ankara

Timur was a Mongol from the Barlas tribe, which had been exposed to and assimilated Turkic culture. He was born in central Asia, in a part of the Chagatai Khanate (now modern Uzbekistan), in the 1320s or 1330s. At some point early in his life, he suffered an injury that left him lame in one leg and without two fingers. According to some stories, he had been wounded while attempting to steal sheep, but he may well have sustained his injuries in battle.

Timur sought to rebuild the empire that Chinggis Khan had controlled at the time of his death. Because he could not establish descent from Chinggis, he could not claim the title of khan himself. In the 1360s, he gained

control of part of the Chagatai Khanate and placed one of Chinggis's descendants, Soyurgatmish, on the throne, claiming to act in his name. He also married a female descendant of Chinggis and adopted the title "Royal Son-in-Law."

Timur soon looked beyond central Asia for lands to control. In the 1380s and 1390s, he conquered Persia, portions of Iraq and Afghanistan, and Syria. He taxed the inhabitants of vanquished cities heavily and sent skilled artisans to work in his capital in Samarkand, but he spared people's lives. Cities that did not submit were treated brutally, however. For example, when the city of Isfahan, in Persia, surrendered peacefully, he treated the residents leniently. However, when the people later rose in revolt, Timur responded unequivocally: he killed an enormous portion of the city's population, with some reports claiming that 100,000 to 200,000 people were killed. Eyewitness accounts report his soldiers amassing piles of severed heads. Timur's troops then turned north to the Russian territory controlled by a former follower named Tokhtamish, the khan of the Golden Horde, who sought the same lands in central Asia that Timur claimed. After destroying the Russian cities of Astrakhan and Ryazan, Timur defeated Tokhtamish's army in 1391.

In the late 1390s, Timur turned eastward toward India. In 1398, he attacked the city of Delhi, the capital of the Muslim-ruled Delhi Sultanate. The sultan's army rode into battle on war elephants clad in chain mail, frightening Timur's troops, who had not seen elephants before ([Figure 17.7](#)). Timur piled hay on the backs of his camels, set the hay on fire, and sent the burning, panicked animals into the enemy's lines, scattering the elephants. Victorious, Timur then destroyed Delhi.

FIGURE 17.7 Timur Defeats the Sultan of Delhi. In this image produced in India around 1600, Timur's Mongol forces, wearing golden helmets, defeat the troops of the sultan of Delhi, who are shown sprawled across the backs of their war elephants. (credit: "Timur defeats the sultan of Delhi" by Zafarnama of Sharaf Al-Din 'Ali Yazdi/Wikimedia Commons, Public Domain)

Timur also coveted lands in Syria that were controlled by the Mamluk Sultanate and territory in Anatolia that was claimed by the Ottomans. Bayezid I had been steadily conquering weaker rulers in Anatolia and forcing them to become his vassals. In 1397, he defeated the ruler of the *beylik* of Karaman and went on to subdue smaller Anatolian states. Unwilling to submit to his domination, however, Turkish tribes and Ottoman vassals who Bayezid I believed owed allegiance to him turned to Timur, considering him their means of achieving independence from Ottoman rule. In turn, enemies of Timur such as Kara Yusuf, the leader of the Black Sheep Turks, and Sultan Ahmed, the ruler of the Persian Mongol Jalayir dynasty whose lands Timur had conquered, turned to Bayezid for assistance. Timur wrote to Bayezid, demanding that the Ottoman ruler cease aiding his enemies. Bayezid responded with insults and sent his forces to attack an ally of Timur's in Armenia.

In 1400, Timur struck back, destroying the city of Sivas in Anatolia, part of Bayezid's domain. He then went on to wage war against the Mamluk sultans in Egypt in Syria, preventing Bayezid from turning to them for help. He also entered into an allegiance with the Byzantines against the Ottomans, amassed forces from throughout

his empire, and headed for Anatolia. Bayezid broke off his siege of Constantinople, which had begun in 1396, and rushed to meet him. In July 1402, Timur's troops clashed with the Ottoman army at the Battle of Ankara in Anatolia.

On the field at Ankara, one of the great weaknesses of Bayezid's Ottoman state was revealed. The Ottomans had built their empire in Anatolia by conquering other Turkish states and absorbing their rulers and the rulers' descendants into their administration. These men, Bayezid's unwilling vassals, had no wish to risk their lives for their Ottoman overlords. In addition, Bayezid had chosen to live primarily at Edirne, in Thrace. He had adopted elements of Greek culture and, as part of a strategy to build alliances with other rulers, had taken as wives or concubines a number of non-Turkish women, including the daughter of Prince Lazar. This decision further alienated him from the Turkish nobility of Anatolia. When Timur's forces attacked at Ankara, therefore, many of Bayezid's Turkish vassals abandoned the field and left Bayezid to his fate, happy to be free of Ottoman control. The Ottomans were defeated, and Bayezid and his sons Musa and Mustafa were captured by Timur. Bayezid remained Timur's prisoner until he died a few months later.

Following his rout of the Ottomans and having conquered most of the domains of Chinggis Khan and his sons and grandsons, Timur turned eastward to claim his last prize—China. In 1368, the Mongol Yuan dynasty in China had come to an end. Its successor, the Chinese Ming dynasty, sought to make a tributary vassal of Timur, but the Ming emissaries and the soldiers who accompanied them had instead been imprisoned in Samarkand, the capital of Timur's empire, in the Mongol heartland near the place of his birth. In December 1404, Timur set out to cross central Asia on his way to China. Within a few months, however, he fell ill, and in February 1405 he died. The invasion of China ended before it had begun, and the Chinese emissaries were released.

At the time of his death, Timur had conquered much of the land claimed in the original Mongol conquests of Chinggis Khan and his descendants. Unlike them, however, Timur made no real effort to rule the places he seized outside Persia. His armies conquered, plundered the riches of the defeated cities, seized artisans and whoever else might be of use to Timur, and sent the wealth and captives on to Samarkand. Thus, it was relatively easy for most places that Timur had conquered to regain their independence. Anatolia is a good example. Following his defeat of Bayezid I, Timur departed, leaving Bayezid's sons to battle among themselves for control of their father's lands. Although Bayezid's son Mehmed declared himself a vassal of Timur, Timur did not assist him in his civil war against his brothers. Following Timur's death, his own sons and grandsons fought over the lands he had conquered ([Figure 17.8](#)). In 1409, his son Shah Rukh emerged as his successor and the next head of the Timurids, the name given to the dynasty founded by Timur.

FIGURE 17.8 The Timurid Empire. By the time of Timur’s death in 1405, his empire stretched from the border of Anatolia in the west to northern India in the east, and from modern Uzbekistan in the north to the Gulf of Hormuz in the south. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

While many in Asia regarded Timur as a villain, he was a hero of the Turks and Mongols of central Asia. Ibn Khaldun, the North African Muslim historian, credited him with unifying the world’s Muslims into a single empire. Timur’s greatest legacy may be an artistic one. Although conquered people might have been met with brutality, artists, architects, and artisans were spared and sent to Samarkand. During Timur’s lifetime, the city was in a constant state of construction, and buildings like the Bibi Khanum Mosque were erected or remodeled to please him. The Muslim traveler Ibn Battuta praised the city’s beauty, and its gardens made visitors forget the arid lands that surrounded it (Figure 17.9). Timur’s grandson Ulugbek built a madrasa (an Islamic school) and an observatory in Samarkand and invited Muslim mathematicians and astronomers to the city, making it an important site of learning in the fifteenth century. Many Europeans of the time also regarded Timur, whom they called Tamerlane (“Timur, the Lame”), as a hero.

(a)

(b)

FIGURE 17.9 The Registan. (a) A word meaning “country of sand” in Persian, the Registan of Samarkand was the public square of Timur’s splendid capital city of Samarkand in what is today Uzbekistan. A center for public gatherings, it was also a center of learning in the city and region, as evidenced by the three madrasas flanking the central square. (b) This image from the *Zafarnama* (“Book of Victories”), an account of Timur’s campaigns, depicts the construction of the Great Mosque for Timur’s new capital in Samarkand. The Ottoman Conquest of the Byzantine Empire

Following the Battle of Ankara in 1402, the sons of Bayezid who had remained free—Mehmed, Suleyman, and Isa—fought among themselves for control of the Ottoman domains. Suleyman held the Ottoman lands in Europe, Isa controlled Anatolia, and Mehmed I ruled Amasya, a region on the Black Sea coast. When Musa was released from Mongol custody, he also joined the fight, and Mustafa later contended for the throne as well.

In 1413, Mehmed emerged victorious in the civil war with his brothers. He and his son and heir Murad II reorganized and expanded the domains of the Ottomans. Members of the cavalry and other highly placed members of the Ottoman administrative and military elite were each granted a **timar**, the right to collect taxes from merchants, farmers, and artisans in a particular geographical area (Figure 17.10). Timars were awarded regardless of religion or ethnicity, and occasionally elite women were given them as well. At times, conquered local elites were allowed to retain control of their former lands as *timariots* (holders of a timar). The taxes they collected supported them, so the state did not need to pay them a salary or hire tax collectors.

FIGURE 17.10 A Member of the Ottoman Cavalry. Administrators and other elites, like this member of the light Ottoman cavalry, were granted timars to reward them for their service and enable them to support themselves. The image is from a mid-seventeenth-century book of miniature drawings of costumes, possibly made in Constantinople. (credit: “Ralamb Sipahi” by Unknown/Wikimedia Commons, Public Domain)

The practice of awarding timars to members of the military ensured their loyalty. The land ultimately belonged to the sultan, who would revoke a timar if the holder did not continue in his service. A timar might also be lost if the population of the land declined; this encouraged timariots to treat the people on their holdings well. Timariots also tried to make the lands they controlled more agriculturally productive. The more crops produced, the more taxes they could collect. They were responsible for maintaining order on their lands, but they could not impose punishments without the permission of a judge appointed by the sultan. The timar was nonhereditary; upon the timariot’s death, the sultan awarded the vacant timar to someone else. This prevented the development of an independent hereditary class of timariots.

The main goal of Mehmed I and Murad II was to conquer Constantinople. Muslim rulers since the seventh century had attempted to capture the Byzantine capital and had always failed. Both Mehmed and Murad realized that in order to rebuild the Ottoman state, they had to drive out the Byzantine rulers. The Byzantine emperor Manuel II had assisted Mehmed’s rivals for the Ottoman throne, attempting to keep the Ottomans weak by prolonging the civil war. The Byzantines were also close allies of the Venetians and Genoese, who controlled trade in the Aegean and the Black Seas and whose ships could interfere with Ottoman efforts to control both sides of the Dardanelles.

Murad II laid siege to Constantinople in 1422, but the effort failed because the Ottomans lacked artillery to destroy the city walls. Murad was also distracted from the siege by his need to combat yet another claimant to the Ottoman throne. As they had done before, the Byzantines called upon European Christians for assistance

against the Ottomans. The pope called for a new crusade, and the Roman Catholic knights of Europe responded. Murad defeated them in 1444 at the Battle of Varna, in eastern Bulgaria (Figure 17.11). Nevertheless, Constantinople stood firm. The city was only a shadow of what it had once been. At its height, somewhere between 500,000 and one million people had lived within its walls, but the bubonic plague and Ottoman sieges had reduced the number to perhaps fifty thousand. Nevertheless, so long as Constantinople stood on the western shore of the Bosphorus controlling access to the Black Sea, the Ottomans could not rest easy in their domains.

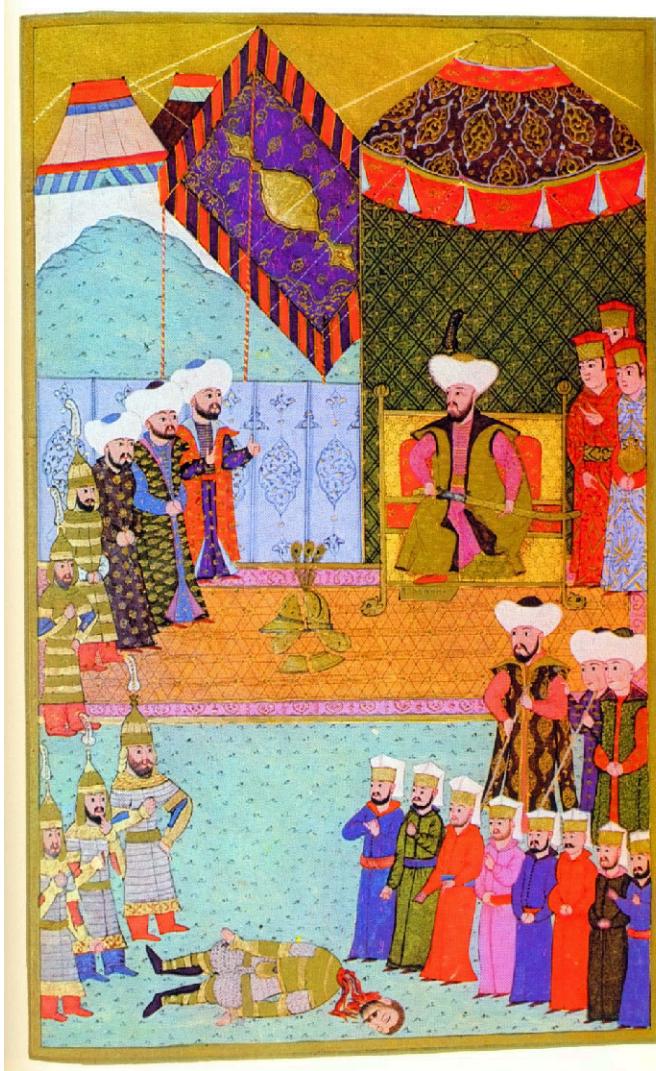

FIGURE 17.11 The Death of Władysław III. According to legend, at the Battle of Varna in which he led Ottoman forces against European Christians, Murad II prayed for victory. When the Polish king Władysław III charged Murad's troops, the sultan's guards beheaded him, an event depicted in this Ottoman miniature. (credit: “Murad II and the imaginary beheading of Władysław III of Poland” by Géza Fehér/Wikimedia Commons, Public Domain)

It fell to Murad II's son Mehmed II (also called Mehmed the Conqueror and Mehmed the Great) to destroy the Byzantine threat. He was better prepared than his father had been. In 1453, he summoned his Muslim and Christian vassals from Anatolia, Thrace, and the Balkans. With the vassals and a core of six thousand elite professional soldiers, he marched to the Bosphorus. Ottoman forces included more than one hundred newly constructed ships to prevent Constantinople from receiving reinforcements and supplies via the sea. He also summoned European gunsmiths, the most important of whom was the Hungarian named Urban, to craft bombards, an early form of cannon. One gun was so large that it could fire a twelve-hundred-pound granite ball more than a mile. Constantinople's defensive walls, which had guarded the city since the fifth century,

could not withstand the Ottoman artillery (Figure 17.12).

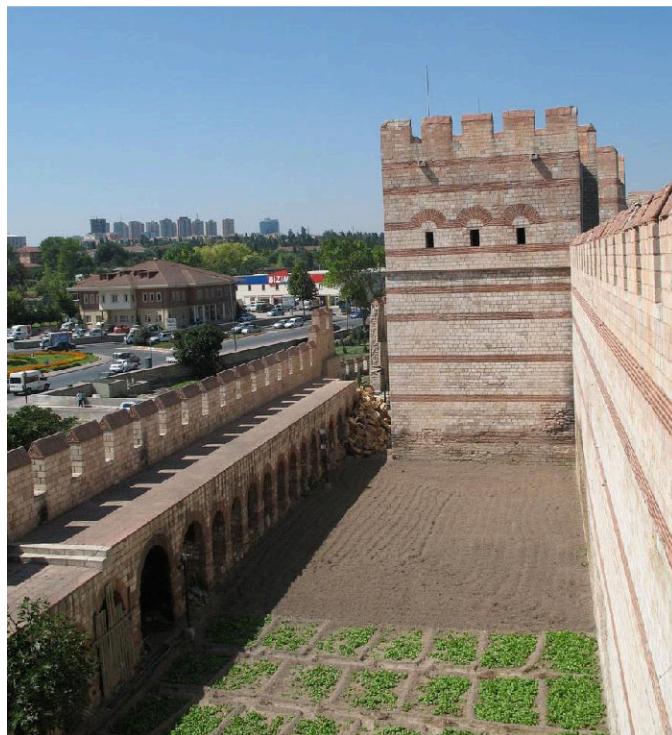

FIGURE 17.12 The Walls of Constantinople. The walls that protected Constantinople were massive. On the right is the inner wall, the city's last defense. In places it was up to six meters thick. On the left is the outer wall. Below this was yet a third wall, and beyond that a moat. (credit: modification of work “Theodosian Walls in Constantinople” by “CrniBombarder!!!”/Wikimedia Commons, Public Domain)

On the morning of May 29, 1453, after a siege of fifty-seven days, the Ottoman guns breached the walls, and Mehmed's soldiers rushed into the city. Perhaps twenty thousand people were left to defend it, including the last Byzantine emperor, Constantine XI Palaeologus, who died fighting for his city. After their Genoese commander was wounded, many defenders abandoned their posts along the walls, leaving them deserted during battle. Constantinople's residents carried religious icons to the walls and prayed for deliverance. However, they put up little resistance, and the city fell to the Ottomans.

DUELING VOICES

The Fall of Constantinople

Following are two accounts by European Christians of the fall of Constantinople in 1453 and the behavior of Mehmed II, the conquering sultan. The first excerpt is from a letter from the Convent of the Order of Saint John on Rhodes to the military commander of Brandenburg (present-day Germany), a principality of the Holy Roman Empire. The second is an eyewitness account of the event.

After the great Turk had besieged Constantinople by land and sea, on the twenty-ninth of the May just passed he seized the city by force of arms, killed the emperor of Constantinople, cut off the heads of many nobles, gave the entire city over to plunder, and cruelly tortured many. He then obtained the city of Pera, which the Genoese held, without force of arms, made it a tributary, and tore down its walls. This also happened to the walls of Constantinople. . . .

It is believed that he is preparing a new fleet from scratch, since he intends to make all the islands of the Aegean archipelago subject to him or to destroy them if he can. For his heart swells with pride and

he boasts that he has equaled or surpassed the deeds of Alexander of Macedon. He also threatens that he will attempt to do what Alexander never did—push into Italy and the regions of the West with his arms and might and see whether fortune shall favor him there as it has throughout the East.

—a letter from the Convent of the Order of Saint John on Rhodes to the Margrave of Brandenburg, June 30, 1453, translated by W.L. North

The enraged Turkish soldiers . . . gave no quarter. When they had massacred and there was no longer any resistance, they were intent on pillage and roamed through the town stealing, disrobing, pillaging, killing, raping, taking captive men, women, children, old men, young men, monks, priests, people of all sorts and conditions. . . . This medley of all nations, these frantic brutes stormed into their houses. . . .

Temples were desecrated, ransacked and pillaged . . . sacred objects were scornfully flung aside, the holy icons and the holy vessels were desecrated. Ornaments were burned, broken in pieces or simply thrown into the streets. . . .

When Mehmed (II) saw the ravages, the destruction and the deserted houses and all that had perished and become ruins, then a great sadness took possession of him and he repented the pillage and all the destruction. Tears came to his eyes and sobbing he expressed his sadness. “What a town this was! And we have allowed it to be destroyed!” His soul was full of sorrow. And in truth it was natural, so much did the horror of the situation exceed all limits.

—“The Sack of Constantinople, 1453,” *EyeWitness to History*, 2011

- In what ways are these accounts similar? How do their depictions of Mehmed II differ?
- How did the Ottomans create a multiethnic military force? Why would that be useful?

Many Muslim scholars believed the conquest of Constantinople had been predicted in a hadith, an account of the sayings and actions of the prophet Muhammad. After his capture of the city, Mehmed turned eastward, incorporating the Turkish state of Karaman, the home of the important Islamic religious center of Konya, and other lands ruled by Turkish tribes in eastern Anatolia. In 1461, he sent the Ottoman fleet to conquer Trebizond, an offshoot of the Byzantine Empire and an important trading center on the Black Sea. In Europe, he gained control of most of the southern part of Greece, defeating the Byzantine princes who ruled the area, as well as Bosnia and Albania. He also wrested the Black Sea port of Kaffa from the control of Genoese merchants. At his death, the Ottoman Empire controlled all of Anatolia and nearly all of the Balkans.

Mehmed II, despite being referred to regularly as “the Conqueror” by historians, was a builder more than a destroyer, however. Upon conquering Constantinople, he declared it the new capital of the Ottoman Empire, replacing the city of Edirne. He dispatched soldiers to clear away the ruins left from the siege and the Ottoman assault, and he immediately set about appointing a mayor and other important city officials to establish and maintain order. Rather than drive out the city’s European merchants, he allowed them to stay, to retain their property, and to continue to worship in their churches. He demanded only that the Genoese merchants remove the walls that surrounded Galata, the Genoese trading quarter of Constantinople, and surrender their armaments. To protect his new Christian subjects, he forbade his Turkish troops to enslave the Europeans.

Mehmed regarded himself not as a usurper but as the rightful successor to the Byzantines. He declared himself Caesar, the heir to the old Roman imperial throne. He appointed a new leader of the Eastern Orthodox Church, Gennadius II, who in turn recognized Mehmed’s claim as the legitimate heir of the last Byzantine emperor. The last emperor’s actual heirs, his nephews, were taken into Mehmed’s service and occupied important administrative positions in the empire. One served as Grand Vizier, or chief minister, under Mehmed’s successor Bayezid II.

Mehmed embarked on an ambitious campaign to rebuild Constantinople, now called Istanbul. He built the new

Topkapi Palace, where he ruled the empire. The palace also contained his private household, or **harem**. He ordered that the Byzantine cathedral of Hagia Sophia be left intact and converted into a mosque. He rebuilt the city walls, constructed a weapons foundry, and established a hospital. He also ordered a new mosque, the Fatih Mosque (“Conqueror’s Mosque”), to be built in the city (Figure 17.13). Near the mosque, he erected numerous madrasas in which Muslim scholars taught science, Islamic law, and theology.

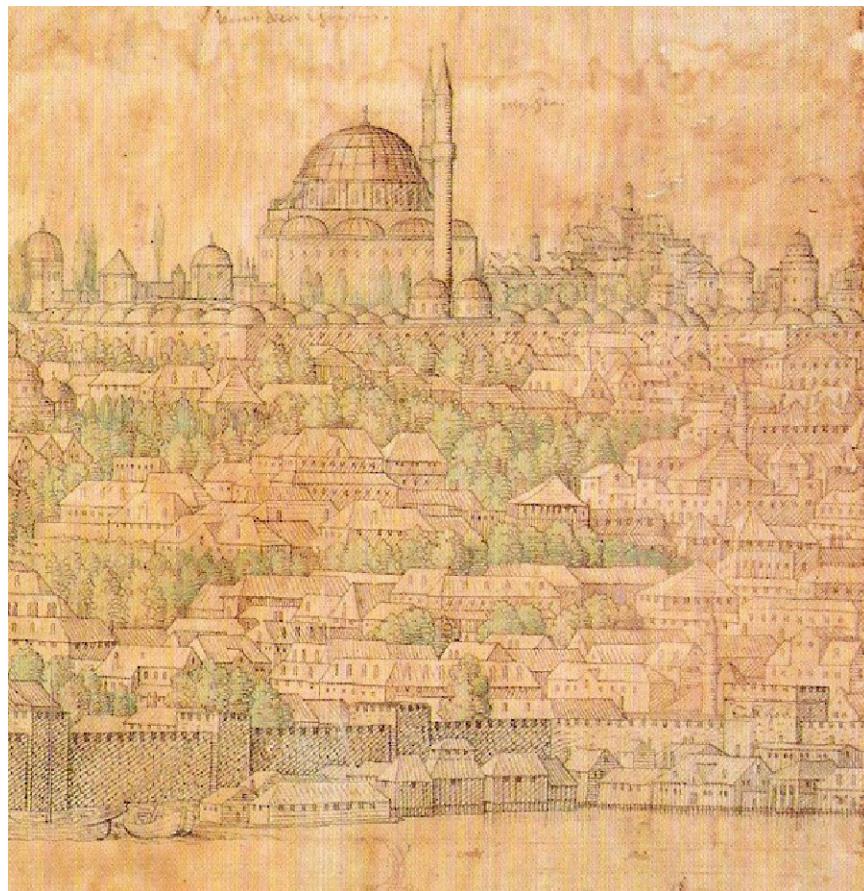

FIGURE 17.13 Fatih Mosque. In Melchior Lorck’s painting of Istanbul from 1559, the Fatih Mosque rises above the rooftops of the city. The building was destroyed by an earthquake in 1766, and a mosque built according to a different plan was subsequently constructed on the site. Mehmed had a great thirst for knowledge. He spoke many languages and amassed a library filled with works in Turkish, Greek, Latin, Persian, and Arabic. He invited Muslim scientists to Istanbul and attended debates of religious scholars. He collected Greek antiquities and brought Greek scholars and Italian artists to Istanbul. Some of these artists, such as the Italians Gentile Bellini and Paolo Veronese, painted portraits of him (Figure 17.14).

FIGURE 17.14 Mehmed II. The meeting of East and West is evident in this portrait of Sultan Mehmed II. Painted in 1480 by the Italian artist Gentile Bellini, it depicts an Eastern ruler in a Western artistic style. (credit: “The Sultan Mehmet II” by Gentile Bellini/Wikimedia Commons, Public Domain)

As Mehmed conquered other parts of the Balkans and of Anatolia, including *beyliks* that had broken free of Ottoman control following Bayezid I's defeat at the Battle of Ankara, he brought artisans and prisoners of war to Istanbul to rebuild the city. As earlier Ottoman rulers had done, Mehmed allowed Christians and Jews in his lands to worship as they pleased. This arrangement was an early appearance of the Ottoman *millet* system, in which religious communities were allowed a substantial degree of autonomy and were governed by their own leaders and their own law codes. In addition to naming a head of the Eastern Orthodox Church, Mehmed established the position of *hakham bashi* (“chief rabbi”) to lead the Ottoman Empire’s Jewish community. He also invited the head of the Armenian Apostolic Church to establish a house of worship in Istanbul; because the Eastern Orthodox Church, the religion of the Byzantine rulers, regarded the Armenian church as heretical, it had been banned from the Byzantine capital. And although the Roman Catholic Church refused to recognize his right to rule Istanbul, Mehmed allowed Catholic clergy to travel throughout Ottoman lands and worship freely.

Mehmed also moved to exert authority over Islamic clergy in his domains. He made teachers at madrasas employees of the Ottoman state. He issued *kanun*, laws made by the sultan, as opposed to sharia (religious law) interpreted by Islamic judges, and compiled them in the *Kanun-name* (“Book of the Law”). *Kanun* dealt with issues that sharia often did not address, such as taxation or punishment for certain crimes. Mehmed also made use of *kanun* to centralize his authority and gain unchallenged control over the Ottoman state.

With the fall of the Byzantine Empire and the collapse of Timurid authority, the Ottoman state could now assert its authority in both the East and the West, effectively making itself a gatekeeper between the two worlds. Following their defeat of the Byzantine Empire and their capture of Constantinople, the Ottomans gained

control of part of the Silk Roads that brought silk, spices, and other luxury goods from East Asia. Besides controlling the overland route, the Ottomans commanded Red Sea ports in Egypt after defeating the Mamluk Sultanate in 1517, which gave them additional control over the spice trade. By the late fifteenth century, Ottoman ships were trading with India, and goods such as Chinese silks and porcelains furnished the homes of the wealthy in Istanbul. The Ottomans also dominated trade on the Black Sea, which until then had been the province of the Venetians and Genoese. The exclusion of Italian merchants from their traditional trade routes, the heavy taxes imposed on goods that traveled overland, many Europeans' dislike for transacting business with Muslims, and the expense of overland trade led western Europeans to seek all-water oceanic routes to South and East Asia.

The Renaissance

The fall of Constantinople was lamented in Europe as signaling that no significant force remained to counter the Muslim advance westward. For many historians, it also marks the end of the European Middle Ages. As the Byzantine Empire collapsed, many Greeks sought refuge in other lands, often wealthy merchants and state officials who brought their riches with them. Many settled in Italy, especially in Venice and Rome. Those who came to Venice were assisted by Anna Notaras, a wealthy Byzantine noblewoman who had taken up residence in the city before Constantinople fell.

Byzantine scholars, theologians, artists, writers, and astronomers also fled westward to Europe, bringing with them the knowledge of ancient Greece and Rome that had been preserved in the eastern half of the Roman Empire after the western half fell. Among the texts they brought were the complete works of Plato and copies of Aristotle's works in the original Greek. Access to these and other writings, many of which had been either unknown in western Europe or known only in the form of Arabic translations that arrived at the time of the Crusades, greatly influenced the course of the Italian Renaissance.

The **Renaissance**, which means “rebirth” in French, was a period of intellectual and artistic renewal inspired by the cultural achievements of ancient Greece and Rome and marking the dawn of the early modern world. It began in the city-states of northern Italy that had grown wealthy through trade, especially trade with the Ottomans. Beginning in the 1300s, scholars there turned to the works of Western antiquity—the writings of the ancient Greeks and Romans—for wisdom and a model of how to live ([Figure 17.15](#)). Among these scholars was Petrarch, who encouraged writers to adopt the “pure” Classical Latin in which the poets and lawmakers of the Roman Empire had written instead of the form of Latin used by medieval clergy. He advocated imitating the style of the Roman orator Cicero and the foremost of the Roman poets, Virgil.

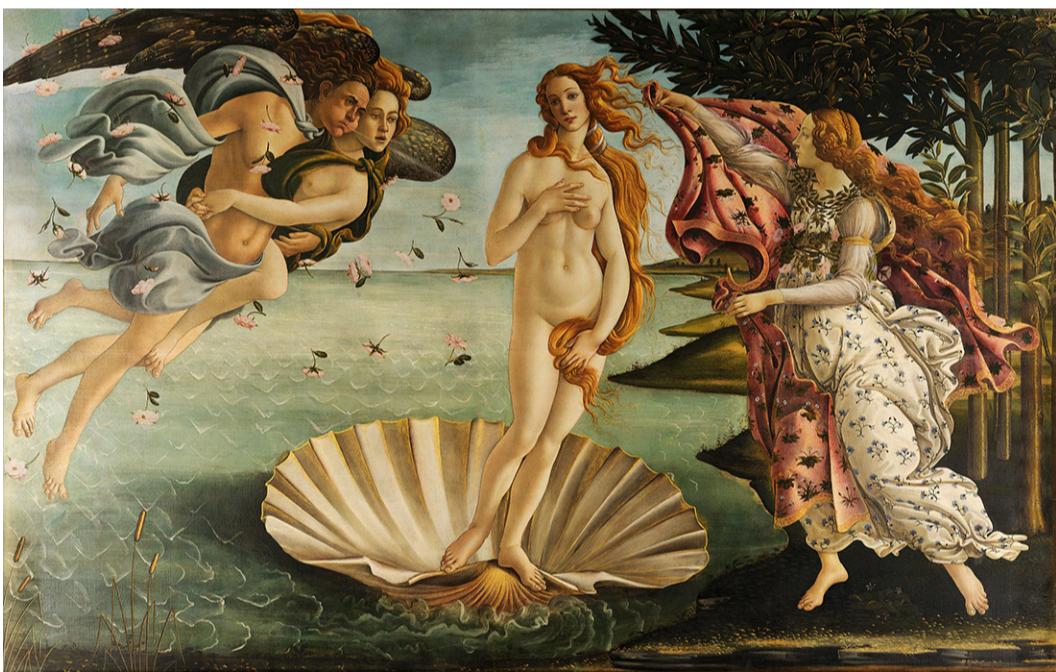

FIGURE 17.15 The Birth of Venus. Sandro Botticelli's 1485 painting *The Birth of Venus* shows the Roman goddess of love and beauty perched on a seashell after having emerged from the water. During the Renaissance, the depiction of scenes from Greek and Roman mythology became common in European art. (credit: modification of work "The Birth of Venus" by Sandro Botticelli/Wikimedia Commons, Public Domain)

Petrarch has been called the father of **humanism**. Humanism was a movement born in Italy in the fourteenth century that focused on the study of human beings, human nature, and human achievements, as opposed to the study of God. Humanists stressed the beauty and dignity of humanity instead of focusing on its sinful, “fallen” nature. They believed the classical worlds of ancient Greece and Rome could provide contemporary people with untold wisdom and a model for life.

BEYOND THE BOOK

The Arnolfini Portrait

Humanism influenced the manner in which people were depicted in works of art as well as the types of people who were portrayed. Many of the subjects of Renaissance paintings were wealthy members of the merchant class. Merchants might appear as worshippers in paintings with religious subject matter, but many paintings of the period also depicted such people in secular settings as well, often in a manner meant to display their wealth. This 1434 painting, by Jan van Eyck, an artist from the Netherlands, is believed to depict the Italian merchant Giovanni Arnolfini and his wife (Figure 17.16). The image may have been painted to commemorate the Arnolfinis' marriage. Mrs. Arnolfini (her exact name is unknown) is not pregnant. The fashions of the time featured gowns with cloth gathered at the front to give the illusion of a large belly, very different from what is considered stylish today.

FIGURE 17.16 The *Arnolfini Portrait*. This oil painting, believed to represent the merchant Giovanni di Nicolao di Arnolfini and his wife at their home in Bruges, was painted in 1434 by Jan van Eyck. (credit: modification of work “The Arnolfini Portrait” by Jan van Eyck/Wikimedia Commons, Public Domain)

- What details in the painting may indicate that the Arnolfinis are wealthy people?
- In what ways do the values of humanism seem to have influenced this painting?
- Why may artists of the time have included members of the merchant class in their paintings?

Before the arrival of Byzantine scholars and their copies of Plato and Aristotle, Italian humanists had focused primarily on the study of rhetoric and ethics. They displayed little interest in metaphysics, the philosophical study of the nature of existence. Access to Plato’s complete works changed that, and many scholars were influenced by Byzantine Neoplatonism, an intellectual movement that sought to synthesize the ideas of Plato, Aristotle, the Stoic philosophers, and Arabic philosophy. One of the most important of the Italian Neoplatonists was Marsilio Ficino, who translated all of Plato’s works from ancient Greek to Latin and synthesized Platonic thought with the teachings of Christianity.

In the Neoplatonic conception, the universe was an ordered hierarchy with God, “the One,” at the top, and

everything else existing as “emanations” of God at descending levels with the earth at the bottom. If God was perfect, the physical world in which humans lived was least perfect. However, Ficino argued, the human soul existed at the center of the universe, because it combined aspects of both the godly world and the physical world in which humans lived. Because humans possessed a soul, they were thus the center of creation. Ficino’s ideas fit well with the humanist perception of human beings as special creatures and worthy of study.

Another Neoplatonist, Nicholas of Cusa (Nicholas Cusanus), also had a profound effect on the Italian Renaissance and one of its most important legacies, the Scientific Revolution of the sixteenth and seventeenth centuries. The Greek philosopher Aristotle had stressed the study of the world through direct observation, a method known as *empiricism*. For Plato, however, the world of ideas, of abstract concepts, was superior to the components of the physical world. Thus, mathematical thought was superior to sensory observation as a way of arriving at ultimate knowledge of the “truth” of the world. Nicholas also stressed that mathematical knowledge of the world was superior to knowledge derived from mere observation. He went so far as to state that through mathematics, humans could know the very mind of God.

The idea that the physical world could best be understood through mathematical formulas was espoused by Johannes Kepler, the German astronomer who believed the model of the universe that made the most sense mathematically was the true model. It was through mathematics that Kepler discovered three of the laws of planetary motion and was able to explain how the planets moved in the heliocentric, or sun-centered, model of the universe earlier proposed by Nicolaus Copernicus ([Figure 17.17](#)). This was the same view of the universe held by the Italian astronomer Galileo Galilei: the true nature of the universe could be discovered only through mathematics.

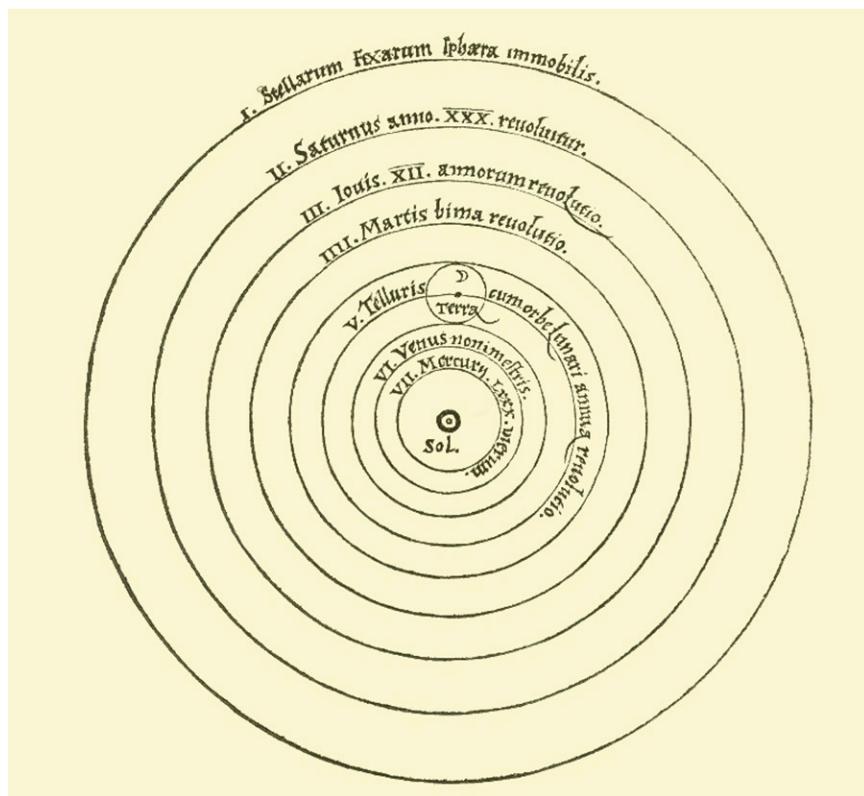

FIGURE 17.17 The Heliocentric Universe. In 1543, Nicolaus Copernicus proposed a model of the universe with the sun at the center, which differed from the medieval Ptolemaic model with the earth in the center. Copernicus’s model does not show any planets beyond Saturn. In his model, beyond Saturn there are only fixed stars. (credit: modification of work “Image of heliocentric model from “De revolutionibus orbium coelestium”” by Nicolaus Copernicus/Wikimedia Commons, Public Domain)

Although the Neoplatonists did not value Aristotle's empiricism, they did not completely cast his ideas aside. First, his concept of "virtue" influenced the humanists' idea of human excellence. And his emphasis on acquiring knowledge through observation influenced scientists in fields other than astronomy. Observation of nature became of importance not only to scientists but also to the visual artists of the Renaissance. The fifteenth-century Florentine painter Masaccio was the first to incorporate the principles of linear perspective into painting (Figure 17.18). The use of linear perspective had been a "secret" known to the ancient Greeks and Romans but lost and then "rediscovered" by the Florentine architect Filippo Brunelleschi, whose drawings inspired Masaccio. This technique created a sense of realism in visual imagery that had been lacking in medieval art. Later artists such as Leonardo da Vinci conducted studies of animal and human anatomy to make their works more realistic. Michelangelo went beyond attempting to make human beings look realistic and instead idealized the body, in keeping with the new position into which the thinkers of the Renaissance had elevated humans.

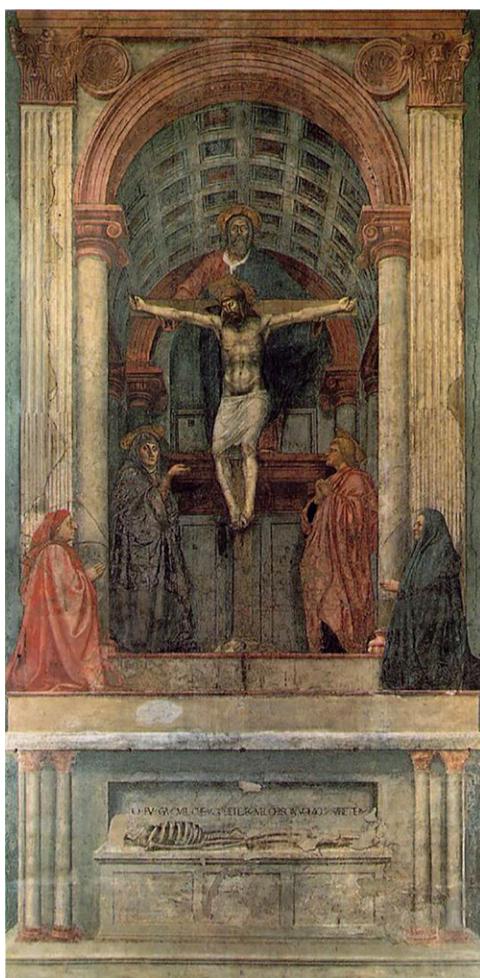

FIGURE 17.18 Linear Perspective. The fresco *Trinity with the Virgin, Saint John the Evangelist, and Donors*, painted around 1427 in the church of Santa Maria Novella in Florence, shows Masaccio's use of linear perspective to create a realistic image of the interior of a building. 17.2 From the Mamluks to Ming China

LEARNING OBJECTIVES

By the end of this section, you will be able to:

- Describe the system of slavery that existed within the Islamic world
- Explain the unique political and social organization of the Mamluk Sultanate
- Describe Ming dynasty China in the fifteenth century and its responses to foreign influences

In the thirteenth century, a new state came into existence in Egypt and the Levant. Although it grew out of the existing Ayyubid Sultanate, the **Mamluk Sultanate** was unique among world societies in that it was administered and defended by educated, elite, formerly enslaved men. The Mamluk state grew so powerful that it was able to fend off the advances of the Mongols. At the opposite end of Asia, the Mongols also found themselves displaced by the Han Chinese of the Ming dynasty.

The Slave Soldier System

Many of the Islamic states formed in western Asia over the centuries relied upon a unique means of staffing their armies and administrations—the creation of a highly trained, foreign-born enslaved (or formerly enslaved) elite. Beginning in the ninth century in the Abbasid Caliphate, rulers purchased Turks from beyond the Oxus River in central Asia to serve as soldiers for the state. Enslaved adult men raised outside the state were loyal to their purchaser and not to the state itself, however, and thus they were more willing to revolt if they were not well treated. Briefly losing control of the state in the ninth century because of such uprisings was a lesson for Muslim rulers. Thereafter, they sought to enslave young boys who could be educated and trained within and by the state, ensuring they were more invested in the society they served as adults. Non-Muslim children were chosen because Islam forbade the enslaving of fellow Muslims.

Known as mamluks (from an Arabic word meaning “someone owned”), the boys were taken primarily from Turkic tribes in central Asia, as well as from the Caucasus and eastern Europe, and then converted to Islam and educated. Because they were freed upon completing their training, the rule against enslaving other Muslims was not violated. The largest part of their instruction consisted of training in riding, archery, and military tactics ([Figure 17.19](#)). Some were given a formal education in the bureaucracy, in a bid to develop smart and capable administrators for the state.

FIGURE 17.19 The Art of Horsemanship. This fourteenth-century illustration from the *Manual of the Arts of Horsemanship* by al-Aqsara'i depicts mounted competitors carrying spears in a game that required great physical skill. As part of their training, young mamluks were taught to ride at a gallop while aiming projectiles at a swinging target. (credit: modification of work “Manual on the Arts of Horsemanship by al-Aqsara’i” by Unknown/Wikimedia Commons, Public Domain)

When the young men’s education was completed, they were set free in a special ceremony. They were then allowed to grow beards, marry, and establish their own households, into which they could introduce purchased mamluks of their own. They might, however, remain in the household of their former owner, the ruler to whom they were expected to remain loyal. In this way, the mamluks somewhat resembled the freed people of ancient Rome, who often retained ties to their former masters.

The relationship between mamluks and their masters was often conceived of as familial in nature, and mamluks often referred to one another as “brother” and to their master as “father.” When their training had ended, their “father” would find a place for them in the ruler’s service. Most mamluks found positions in the army, and from there they often went on to hold administrative positions. In the Ayyubid Sultanate, the mamluks eventually gained control over the government after deposing the sultan and proceeded to rule the state as the Mamluk Sultanate.

In Mamluk Egypt, having been an enslaved soldier was often the path to the greatest success and standing in society. Important positions were given to mamluks, such as provincial governor and commander of the yearly pilgrimage to Mecca. The sultan himself was a mamluk. Appointed mamluks were regarded as more entitled to positions of power and authority than were a man’s biological sons, and while Egyptian mamluks married and produced children, it was considered inappropriate if these offspring were awarded important roles in government when true mamluks were available. The mamluks were displeased when this happened, and it was they who usually determined who became the sultan.

While it might seem like a risk to entrust important governmental and military positions to men who had once been enslaved, the Ayyubids, who had broken away from the Abbasid state to found their own dynasty in the eleventh century, adopted the system because of its advantages. The mamluks were highly trained and well educated, and thus well prepared to occupy the offices given to them. A ruler could pick and choose the most able of them, whereas biology might leave a sultan with children entirely unsuited to occupy positions of authority. The fact that the mamluks were of non-Arab origin and had been taken from their homes in foreign lands as children also meant they were likely to remain loyal to the “father” who had been responsible for their training, and to whom they owed their position in society. While the offspring of the Arab nobility might act to advance the fortunes of their families in ways that did not suit the interests of the sultan, the sultan usually did not need to fear that his mamluks would favor the interests of far-distant, long-absent biological relatives over his own.

Enslaved men occupied a similar position in the Ottoman Empire. Beginning in the fourteenth century, the Ottomans purchased enslaved people or used prisoners of war to fill the ranks of their armies. With their invasion of the Balkans, however, the Ottoman sultans soon turned to gathering Christian children from the European lands they occupied, in order to counter the power of the Turkish nobles who controlled the army and the state’s administration.

In a system known as the ***devshirme*** (“gathering”), Ottoman agents recruited Christian boys as part of the tax imposed on their European subjects ([Figure 17.20](#)). Approximately every three to five years, agents of the sultan took boys, ideally aged between eight and ten, to serve the Ottoman state. They were taught to speak Turkish and brought to Istanbul where they were educated and made to convert to Islam. When they became adolescents, they were trained to become scribes, palace administrators, or soldiers. Those selected to serve in the palace at the end of their training often rose to occupy important positions, including Grand Vizier. In addition, many were awarded timars in exchange for their service and had the opportunity to become wealthy.

FIGURE 17.20 The *Devshirme*. In this Ottoman miniature painting from 1558, Christian parents look on as their sons are led away to be enslaved by the sultan. The children carry a few personal possessions in sacks over their shoulders as the seated Ottoman official registers them. (credit: “Janissary Recruitment in the Balkans” by Ali Amir Beg/Wikimedia Commons, Public Domain)

The majority of boys were trained as soldiers, some of whom became members of the elite infantry corps called the **Janissaries** (from the Turkish words *yeni cheri*, or “new soldier”). They accompanied the sultan into battle and served as his household guard. Like the mamluks, the Janissaries were expected to be loyal to their master, the Ottoman sultan. In fact, the sultans believed the Janissaries would prove more dependable than the noble vassals, because they were entirely dependent upon the sultans for their status and privileges, and because they had been cut off from the biological families to whom they might otherwise have owed their first loyalty. The risk of trusting in the Turkish nobility had become clear at the Battle of Ankara when Bayezid I’s Turkish vassals fled, abandoning him to the Mongols.

IN THEIR OWN WORDS

Memoirs of a Janissary

The account that follows is by a Serbian named Konstantin Mihailović. Born in 1430, he was taken as a child to be trained as a Janissary and recorded his experiences in a book, *Memoirs of a Janissary*, written between 1490 and 1501.

And from there the Emperor [the Ottoman Sultan] marched and surrounded a city which they call Novo Brdo, "Mountain of Silver and Gold," and having attacked it, conquered it, but by means of an agreement: he promised to let them keep their possessions and also not to enslave their young women and boys . . . Having arrived in the city the Turks ordered all the householders with their families, both males and females, to go out of the city through the small gate to a ditch, leaving their possessions in the houses. And so it happened that they went one after another, and the Emperor himself standing before the small gate sorted out the boys on one side and the females on the other, and the men along the ditch on one side and the women on the other side. All those among the men who were the most important and distinguished he ordered decapitated. The remainder he ordered released to the city. As for their possessions, nothing of theirs was harmed. The boys were 320 in number and the females 74. The females he distributed among the heathens, but he took the boys for himself into the Janissaries, and sent them beyond the sea to Anatolia, where their preserve is.

I was also taken in that city with my two brothers, and wherever the Turks to whom we were entrusted drove us in a band, and wherever we came to forests or mountains, there we always thought about killing the Turks and running away by ourselves among the mountains, but our youth did not permit us to do that; for I myself with nineteen others ran away from them in the night from a village called Samokovo. Then the whole region pursued us, and having caught and bound us, they beat us and tortured us and dragged us behind horses. It is a wonder that our soul remained in us. Then others vouched for us, and my two brothers, that we would not permit this anymore, and so they peacefully led us across the sea.

—Konstantin Mihailović, *Memoirs of a Janissary*

- How does Mihailović feel about the Ottomans? Why does he feel this way?
- How loyal a Janissary was he likely to have been? Why?
- While the Janissaries were elite members of Ottoman society, they remained enslaved people. What sense does this excerpt and the rest of the chapter give you of the Janissary experience?

The Janissaries held high status in Ottoman society. Although many parents protested the taking of their children and sometimes rebelled against the system, others who hoped to provide their sons with a means of advancing in society reportedly bribed Ottoman officials to select them. Some Muslim parents, whose sons were not subject to the *devshirme*, supposedly even lied about their religion to secure a spot for them in the sultan's service.

The sultans also kept other kinds of enslaved people. Christian women from foreign lands were purchased in slave markets, and others were given to the sultan as gifts or taken as prisoners of war. They were placed in the sultan's harem, where they lived among his children and female relatives and served the ladies of the court as attendants. Women in the harem were ranked according to a strict hierarchy in which they could advance based on talent and length of service. The minority chosen to become sexual partners of the sultan were also elevated, especially if they bore him children. Some became the mothers of future sultans and were given the title "lady." They might hold great power. While some of these women held great power, most remained servants, and after a few years of service, they were usually released from their duties and married to palace officials. Guarding the Ottoman harem were enslaved eunuchs, castrated men who were usually purchased in slave markets in Africa and whose perceived differences in sexuality led them to be assigned made them well suited to important roles such as managing the household of the ruler and other nobles. Despite their enslaved status, the control these men exerted over the harem gave them great power.

Although the mamluks and enslaved men and women who served the Ottoman sultan were considered among the elite of their societies and occupied relatively privileged positions, people other than sultans owned

enslaved people who performed hard physical labor on farms or as domestic servants. They might be poorly fed and clothed and were neither paid nor educated. They also could not expect to gain their freedom. As property, they could be pawned or sold at their owner's whim, and regardless of age, they might be sexually abused. The experiences of these people were far more typical and representative of the enslaved, including Africans enslaved in the Americas beginning in the sixteenth century, than were those of the mamluks, the Janissaries, or the women of the Ottoman harem.

The Mamluk Sultanate

The mamluks of Egypt reached the pinnacle of their unusually high status in 1250. In that year, they deposed the last Ayyubid sultan, then only a child, and took control of the state.

The Ayyubids, who ruled the Levant and Egypt beginning in the eleventh century, had established their dynasty by breaking away from the Abbasid Caliphate. In the early 1200s, as the members of the Ayyubid ruling family competed with one another for supremacy, they amassed large numbers of mamluk guards and soldiers, consisting mostly of Kipchak Turks from the steppes north of the Black Sea, to assist them. When rulers defeated brothers and uncles in their quest for power, they also took control of their mamluk forces. Soon the mamluk troops vastly outnumbered the members of the Ayyubid Arab ruling class.

In 1249, Sultan as-Salih Ayyub died. His son replaced him but was assassinated by mamluks in 1250. As-Salih's widow, Shajur al-Durr, also ruled briefly, but she was soon deposed. The Ayyubid commander of the city of Aleppo in Syria initially challenged mamluk rule and took an army to Egypt to reclaim control of the state, prompting the mamluk commander Aybak, whom Shajur al-Durr had married to bolster her own claim to power, to place an Ayyubid royal child on the throne as a puppet ruler and his nominal "master." Following his defeat of the Ayyubid forces, Aybak deposed the child sultan and took power in his own right, permanently ending Ayyubid rule in Egypt and formally establishing the Mamluk Sultanate. When Aybak was assassinated in 1257, his teenage son took the throne, but true power in Egypt was wielded by another mamluk commander, Saif ad-Din Qutuz.

The new Mamluk Sultanate soon found its power tested by the arrival of invading Mongol forces. In 1258, Hulagu Khan attacked and destroyed Baghdad, the seat of the Abbasid Caliphate. His troops then took the city of Damascus, which lay within the territory claimed by the Mamluk Sultanate. Hulagu demanded that Qutuz surrender Egypt, but the sultan refused. In 1260, the Mongol and Mamluk armies clashed at the Battle of Ain Jalut, in what is today modern-day Israel, and the Mamluks were triumphant. This halted the Mongol advance in western Asia and prevented them from invading North Africa.

Qutuz did not live to relish the Mamluk victory over the Mongols, however. Shortly after his triumph at Ain Jalut, he was assassinated, and a rival mamluk commander, Baybars, claimed the throne as sultan. Baybars established the Bahri dynasty, named for the location in Cairo of the mamluk barracks from which he had come. The rulers of the Bahri dynasty were mamluks of primarily Turkish origin. Unlike members of most dynasties, they were not generally descendants of the founder. Two of Baybars' sons succeeded to the throne following his death, but they were quickly deposed by rival mamluk army factions. This was the case for most Mamluk sultans, who each ruled for an average of only seven years, and often much less.

Stability was a constant problem for the Mamluk Sultanate. Although it remained in control of Egypt and the Levant until it was defeated by the Ottomans in 1517, the sultans' rule was never secure. Sultans were routinely deposed—and often murdered—by rival claimants to the throne. Provincial administrators often rebelled against the authority of Cairo as well. The problem lay in the origin of the mamluks themselves. Having undergone rigorous training and the experience of enslavement, and having risen through the ranks based solely on their abilities, the mamluks were scornful of those who had not had a similarly harsh upbringing and won their position based on merit. Thus, when sultans attempted to establish their biological sons as their heirs, the army often regarded them as unworthy and refused to follow them. Furthermore, while mamluk soldiers were loyal to their masters, they did not feel similar loyalty to other commanders. When a

sultan died or was deposed, his mamluks were not inclined to obey the person who took his place. The succession to the throne of the Mamluk Sultanate thus always remained uncertain as the army continued to assert its right to choose (and depose) the ruler. Mamluk history was marked by repeated attempts by individual commanders to seize power, and by the army's removal of "unworthy" rulers in favor of others.

Despite the fact that the line of succession always remained unclear, the Mamluk Sultanate was a force to be reckoned with, and its troops were successful at defeating their enemies. Beginning during the rule of Baybars, for example, the Mamluks gradually retook control of the Christian Crusader States in the Levant, either razing their fortresses or converting them to Mamluk garrisons. The final Christian stronghold, Acre, fell in 1291. The Mamluks also defeated the Christian Armenian Kingdom of Cilicia and stopped an attempted Mongol invasion of Syria in 1313 before establishing a peace treaty with the Ilkhanate Mongols in Persia in 1322 ([Figure 17.21](#)).

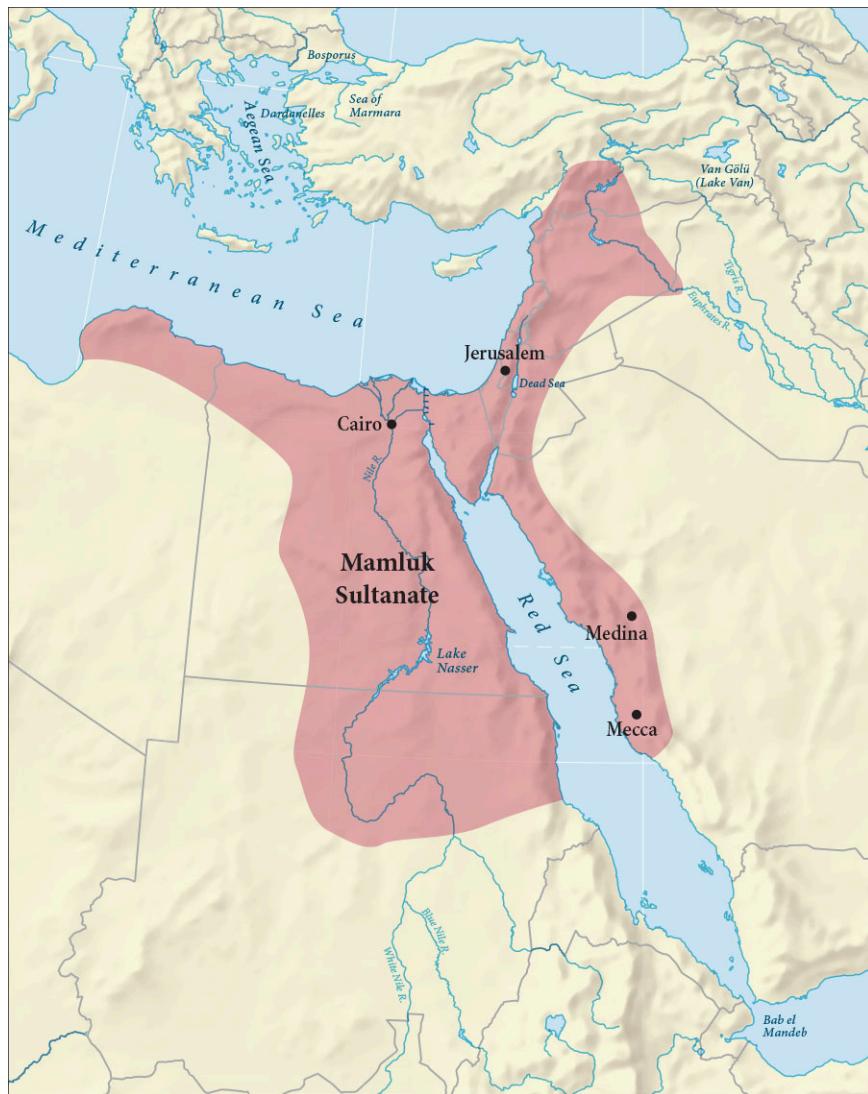

FIGURE 17.21 The Mamluk Sultanate. This map shows the territory claimed by the Mamluk Sultanate at its greatest extent in 1317. The empire controlled access to the eastern Mediterranean, the Red Sea, and the Nile as well as the holy cities of Mecca, Medina, and Jerusalem. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

During the first century of Mamluk rule, the time of the Bahri dynasty, the empire flourished. Following the capture of Baghdad by the Mongols in 1258 and the execution of Caliph al-Musta'sim, members of the Abbasid family sought refuge in Egypt. In 1261, Baybars proclaimed al-Mustansir, the nephew of al-Musta'sim, the new caliph. In return, al-Mustansir recognized Baybars's authority to rule over the lands once held by the Abbasids.

Thus, while the Mamluk sultans never claimed the caliphate for themselves, they sought legitimacy for their rule through their role as protectors of the caliph.

Mamluk rulers were pious Muslims who protected pilgrims bound for the holy cities of Mecca, Medina, and Jerusalem. They built mosques and madrasas, and Cairo grew into an important center of religious scholarship. Unwilling to risk the displeasure of Muslim judges, the mamluks supported all four major schools of Islamic law. They also built hospitals, primary schools, and public fountains to provide the poor with clean drinking water. Their championing of Islam and their building of charitable institutions provided them with an important connection to their non-Turkish subjects, who might otherwise have resented their rule.

LINK TO LEARNING

Although the Mamluk Sultanate is known primarily for the military prowess of its armies, Mamluk society also produced unique architecture and prized works of art. You can learn more about [Mamluk art and architecture](https://openstax.org/l/77MamlukArchi) (<https://openstax.org/l/77MamlukArchi>) at the Metropolitan Museum of Art website.

In the late fourteenth century, a new Mamluk dynasty came to power—the Burji, also named for the location of its mamluk barracks. The Burji sultans were mamluks of primarily Circassian and Georgian origin, unlike the Turks of the Bahri dynasty. The first Burji sultan, al-Zahir Barquq, assumed the throne in 1382. Almost immediately, plots emerged to remove him, one headed by the caliph who hoped to rule in his own right and another by Turkish tribes in Syria. Both attempts were defeated, but the peace did not last long. In 1399, 1434, and 1437, soldiers rioted in the streets of Cairo. Sometimes the riots began as conflicts between rival mamluk factions that spread to the streets and involved civilians. At other times, soldiers rioted when they had not been paid. In 1441, riots were sparked by food shortages and the perception that the grain trade, from which government officials profited, was inefficient and the prices unfair. Merchants' stores were plundered by angry mobs. In the second half of the fifteenth century, mamluk-initiated chaos erupted nearly every year as soldiers fought in the streets and attacked the homes of the wealthy and government officials. Even religious scholars were not safe.

Unable to maintain order in their own capital, Mamluk rulers also had to confront rebellions in more far-flung parts of their domain. The Mamluks had difficulty establishing control over Syrian Arabs and the nomadic and seminomadic Bedouin tribes of Upper Egypt. Bedouin rebels were punished severely; men were impaled or burned alive, while women and children were enslaved. The heads of rebels were placed on the gates of Cairo as a warning against future revolts. Syrian Arabs were punished less harshly because their assistance was needed to repel attacks by Mongols and the Ottomans.

Although they remained an elite class in Egypt until 1811, the Mamluks found their sovereignty over the region threatened when they lost control of Syria to the Ottomans in 1516. The Ottoman sultan Selim I then conquered Cairo in 1517. Rather than depose the Mamluks, however, the Ottomans allowed them to rule their old domains on their conquerors' behalf, though true power lay with the Ottomans in Istanbul.

Ming China and Its Neighbors

The ascendance of the Turks and the decline of Mongol rule in western Asia in the thirteenth century were soon followed by the decline of Mongol dominance in East Asia as well. By the second half of the thirteenth century, China found itself beset by problems. The Yuan dynasty emperor Kublai Khan waged a series of expensive campaigns against the kingdoms of Burma (now Myanmar), Annam, and Champa in Southeast Asia, and Java in the Indian Ocean. Two attempts to invade Japan failed, and revolts against Mongol rule erupted.

One of these revolts was the Ispah Rebellion, which began in Quanzhou. A major port city in southeastern China's Fujian Province, Quanzhou was on the Maritime Silk Road, an ocean trading route that connected China to other trading ports in Southeast Asia, the Indian Ocean, India, the Arabian Peninsula, East Africa, and Egypt. Along this route, highly sought-after Chinese goods like porcelain and silk flowed westward to Europe,

Africa, India, and western Asia.

Quanzhou had a population of more than two million, making it the largest port in China and likely in the world in the thirteenth century. Most of the population were foreign-born merchants from Arabia, Persia, India, Armenia, and other lands. The Muslims who lived in Quanzhou were among the many Arabs, Persians, and Turks from western and central Asia who had come to China to trade or to serve the Yuan government. Though they encouraged Muslims from elsewhere in Asia to settle in China, Yuan officials often discriminated against them, forbidding the butchering of animals according to Islamic law and interfering with Muslim marriage laws and efforts by the Muslim community to govern themselves. In 1357, Muslims in Quanzhou rose against the Mongols. The rebellion was not crushed until 1367.

Attempts to suppress such revolts, which continued after the death of Kublai, drained the treasury, as had Kublai's unsuccessful military campaigns. His successors often mismanaged the treasury and sometimes held the throne for only brief periods of time. By the first half of the fourteenth century, natural disasters were compounding the difficulties China already faced. Droughts and floods led to food shortages and famines. Inflation and scarcity combined to raise the price of food beyond the reach of many peasants. Unusually cold weather worsened people's suffering, and from the 1330s through the 1350s, epidemics swept through various parts of the country, killing millions. Bandits roamed the countryside, and the army made little effort to hunt down the numerous outlaws who preyed on the populace.

A number of religious sects arose foretelling the end of days. One of these was the White Lotus, a sect of Buddhism that announced the coming of a new Buddha and thus a new age ([Figure 17.22](#)). Seizing on the White Lotus prophecy, a secret peasant society named the **Red Turbans** called for the overthrow of Mongol rule and the return of the Song dynasty. Armed rebellion broke out in 1351. In 1352, a young wandering Buddhist monk named Zhu Yuanzhang joined the Red Turbans and married the daughter of one of its leaders. In 1356, his forces captured the southern Chinese city of Nanjing. After eliminating his rivals within the Red Turbans, in 1368 Zhu defeated the last Yuan emperor, who then abandoned China. Zhu destroyed the Yuan palace in the capital of Dadu (Beijing), proclaimed himself emperor with the name of Hongwu, meaning vast and martial, and dubbed his new dynasty the Ming ("bright").
